Exercise 1 : Probability Basics (Conditional Independence)

There are eight boxes containing different colored balls as shown in the illustration below:

The balls can be green, blue, yellow, or red (also marked a, b, c, d in the figure). When picking one of the eight boxes at random, let A refer to the event "box contains a green ball," B to the event "box contains a blue ball," C to the event "box contains a yellow ball," and D to the event "box contains a red ball." Hence,  $A \cap B$  is the event "box contains both a green and a blue ball," etc.

(a) Calculate P(A), P(B), P(C), and P(D).

Answer  

$$P(A) = P(B) = P(D) = \frac{4}{8} = \frac{1}{2}; P(C) = \frac{3}{8}$$

(b) Calculate  $P(A \cap B)$ ,  $P(A \cap C)$ ,  $P(B \cap C)$ , and  $P(B \cap D)$ .

```
Answer
```

$$P(A \cap B) = P(B \cap C) = P(B \cap D) = \frac{2}{8} = \frac{1}{4}, P(A \cap C) = \frac{1}{8}.$$

- (c) Check all that apply:
  - $\mathbf{X}$  The events A and B are statistically independent.
  - The events A and C are statistically independent.
  - The events *B* and *C* are statistically independent.
  - $\mathbf{X}$  The events B and D are statistically independent.

Answer

A and B are independent because  $P(A)P(B) = P(A \cap B)$  (or, equivalently,  $P(A) = P(A \mid B)$ ). The same holds for B and D.

(d) Calculate  $P(A \mid C)$ ,  $P(B \mid C)$ , and  $P(A \cap B \mid C)$ .

Answer

$$P(A \mid C) = \frac{1}{3}, P(B \mid C) = \frac{2}{3}, P(A \cap B \mid C) = \frac{1}{3}.$$

(e) Calculate  $P(B \mid D)$ ,  $P(C \mid D)$ , and  $P(B \cap C \mid D)$ 

Answer  

$$P(B \mid D) = \frac{2}{4} = \frac{1}{2}, P(C \mid D) = \frac{2}{4} = \frac{1}{2}, P(B \cap C \mid D) = \frac{1}{4}.$$

(f) Check all that apply:

 $\Box$  The events A and B are conditionally independent given C.

 $\mathbf{X}$  The events B and C are conditionally independent given D.

## Answer

Since  $P(B \mid D)P(C \mid D) = P(B \cap C \mid D)$ , the events B and C are conditionally independent given D.

### Exercise 2 : Bayes' Rule

A hospital database contains diagnoses  $(C_1 \dots C_5)$  for 8 patients along with binary observations of symptoms  $S_1 \dots S_9$ :

Patient	Diagnosis	Symptoms								
		$\overline{S_1}$	$S_2$	$S_3$	$S_4$	$S_5$	$S_6$	$S_7$	$S_8$	$S_9$
1	$C_1$	1	0	1	0	1	0	0	0	0
2	$C_2$	0	1	0	1	1	0	1	0	0
3	$C_3$	1	0	1	0	0	1	0	1	0
4	$C_4$	0	1	0	1	1	0	1	0	0
5	$C_3$	1	0	1	0	0	0	0	1	0
6	$C_5$	0	0	0	0	1	0	0	0	1
7	$C_3$	1	0	1	0	0	1	0	0	0
8	$C_2$	0	1	0	0	0	0	1	0	0

(a) Compute based on the database the prior probabilities  $P(C_i)$  for each diagnosis.

$$P(C_1) = \frac{1}{8} = 0.125$$

$$P(C_2) = \frac{2}{8} = \frac{1}{4} = 0.25$$

$$P(C_3) = \frac{3}{8} = 0.375$$

$$P(C_4) = \frac{1}{8} = 0.125$$

$$P(C_5) = \frac{1}{8} = 0.125$$

(b) Compute based on the database the posterior probabilities  $P(C_i | S_4)$  for each diagnosis.

#### Answer

First, compute  $P(S_4|C_i), i = 1, ..., 5$ :

$$P(S_4|C_1) = \frac{P(S_4 \cap C_1)}{P(C_1)} = 0.0$$

$$P(S_4|C_2) = \frac{P(S_4 \cap C_2)}{P(C_2)} = 0.5$$

$$P(S_4|C_3) = \frac{P(S_4 \cap C_3)}{P(C_3)} = 0.0$$

$$P(S_4|C_4) = \frac{P(S_4 \cap C_4)}{P(C_4)} = 1.0$$

$$P(S_4|C_5) = \frac{P(S_4 \cap C_5)}{P(C_5)} = 0.0$$

Then, compute the a-posteriori probabilities  $P(C_i|S_4), i = 1, ..., 5$ :

$$\begin{split} P(C_1|S_4) &= \frac{P(C_1) \cdot P(S_4|C_1)}{\sum_{j=1}^5 P(C_j) \cdot P(S_4|C_j)} = \frac{\frac{1}{8} \cdot 0}{\frac{1}{8} \cdot 0 + \frac{1}{4} \cdot \frac{1}{2} + \frac{3}{8} \cdot 0 + \frac{1}{8} \cdot 1 + \frac{1}{8} \cdot 0} = \frac{0}{\frac{2}{8}} = 0\\ P(C_2|S_4) &= \frac{P(C_2) \cdot P(S_4|C_2)}{\sum_{j=1}^5 P(C_j) \cdot P(S_4|C_j)} = \frac{\frac{1}{4} \cdot \frac{1}{2}}{\frac{1}{8} \cdot 0 + \frac{1}{4} \cdot \frac{1}{2} + \frac{3}{8} \cdot 0 + \frac{1}{8} \cdot 1 + \frac{1}{8} \cdot 0} = \frac{\frac{1}{\frac{8}{8}}}{\frac{2}{8}} = \frac{1}{2}\\ P(C_3|S_4) &= \frac{P(C_3) \cdot P(S_4|C_3)}{\sum_{j=1}^5 P(C_j) \cdot P(S_4|C_j)} = \frac{\frac{3}{8} \cdot 0}{\frac{1}{8} \cdot 0 + \frac{1}{4} \cdot \frac{1}{2} + \frac{3}{8} \cdot 0 + \frac{1}{8} \cdot 1 + \frac{1}{8} \cdot 0} = \frac{0}{\frac{2}{8}} = 0\\ P(C_4|S_4) &= \frac{P(C_4) \cdot P(S_4|C_4)}{\sum_{j=1}^5 P(C_j) \cdot P(S_4|C_j)} = \frac{\frac{1}{8} \cdot 0 + \frac{1}{4} \cdot \frac{1}{2} + \frac{3}{8} \cdot 0 + \frac{1}{8} \cdot 1 + \frac{1}{8} \cdot 0}{\frac{2}{8}} = \frac{1}{2}\\ P(C_5|S_4) &= \frac{P(C_5) \cdot P(S_4|C_5)}{\sum_{j=1}^5 P(C_j) \cdot P(S_4|C_j)} = \frac{\frac{1}{8} \cdot 0 + \frac{1}{4} \cdot \frac{1}{2} + \frac{3}{8} \cdot 0 + \frac{1}{8} \cdot 1 + \frac{1}{8} \cdot 0}{\frac{2}{8}} = 0 \end{split}$$

## Exercise 3 : Naïve Bayes

Given is the following dataset to classify whether a dog is dangerous or well-behaved in character:

Color	Fur	Size	Character (C)
brown	ragged	small	well-behaved
black	ragged	big	dangerous
black	smooth	big	dangerous
black	curly	small	well-behaved
white	curly	small	well-behaved
white	smooth	small	dangerous
red	ragged	big	well-behaved

(a) Determine the parameters  $P(A_i)$  and  $P(B_{j=x_j} | A_i)$  for a Naïve Bayes classifier on this dataset.

# Answer

Class priors:

$$P(C = well-behaved) = \frac{4}{7}$$
  
 $P(C = dangerous) = \frac{3}{7}$ 

Attribute-value probabilities given class:

Attribute	Value $(x_j)$	Class $(c_i)$	$P(B_{j=x_j} \mid A_i)$
Color	brown	well-behaved	$\frac{1}{4} = 0.25$
Color	brown	dangerous	0.00
Color	black	well-behaved	$\frac{1}{4} = 0.25$
Color	black	dangerous	$\frac{2}{3} = 0.6\bar{6}$
Color	white	well-behaved	$\frac{1}{4} = 0.25$
Color	white	dangerous	$\frac{1}{3} = 0.3\bar{3}$
Color	red	well-behaved	$\frac{1}{4} = 0.25$
Color	red	dangerous	0.00
Fur	ragged	well-behaved	$\frac{1}{2} = 0.50$
Fur	ragged	dangerous	$\frac{1}{3} = 0.3\bar{3}$
Fur	smooth	well-behaved	0.00
Fur	smooth	dangerous	$\frac{2}{3} = 0.6\bar{6}$
Fur	curly	well-behaved	$\frac{1}{2} = 0.50$
Fur	curly	dangerous	0.00
Size	small	well-behaved	$\frac{3}{4} = 0.75$
Size	small	dangerous	$\frac{1}{3} = 0.3\bar{3}$
Size	big	well-behaved	$\frac{1}{4} = 0.25$
Size	big	dangerous	$\frac{2}{3} = 0.6\bar{6}$

(b) Classify the new example  $\mathbf{x} = (black, ragged, small)$  using your Naïve Bayes classifier. Answer

For reduced verbosity, let the following events be defined:  $A_1 = (C = well-behaved)$ ,  $A_2 = (C = dangerous)$ ,  $B_1 = (C = black)$ ,  $B_2 = (C = ragged)$ ,  $B_3 = (C = small)$ .

With the Naïve Bayes assumption we have:

$$P(A_1 \mid B_1, B_2, B_3) = \frac{P(A_1) \cdot P(B_1, B_2, B_3 \mid A_1)}{P(B_1, B_2, B_3)}$$
$$\underset{\approx}{\overset{\mathsf{NB}}{\approx}} \frac{P(A_1) \cdot \prod_{j=1}^3 P(B_j \mid A_1)}{\sum_{i=1}^2 P(A_i) \prod_{j=1}^3 P(B_j \mid A_i)}$$

and equivalently for  $A_2$ ; The denominator in both cases is:

 $\begin{array}{l} (P(A_1) \cdot P(B_1 \mid A_1) \cdot P(B_2 \mid A_1) \cdot P(B_3 \mid A_1)) + \\ (P(A_2) \cdot P(B_1 \mid A_2) \cdot P(B_2 \mid A_2) \cdot P(B_3 \mid A_2)) = \left(\frac{4}{7} \cdot \frac{1}{4} \cdot \frac{1}{2} \cdot \frac{3}{4}\right) + \left(\frac{3}{7} \cdot \frac{2}{3} \cdot \frac{1}{3} \cdot \frac{1}{3}\right) = \frac{3}{56} + \frac{2}{63} = \frac{43}{504} \approx 0.085 \end{array}$ 

Hence, we get:

$$P(A_1 \mid B_1, B_2, B_3) \approx \frac{\frac{4}{7} \cdot \frac{1}{4} \cdot \frac{1}{2} \cdot \frac{3}{4}}{\frac{43}{504}} = \frac{27}{43} \approx 0.628$$

and

$$P(A_2 \mid B_1, B_2, B_3) \approx \frac{\frac{3}{7} \cdot \frac{2}{3} \cdot \frac{1}{3} \cdot \frac{1}{3}}{\frac{43}{504}} = \frac{16}{43} \approx 0.372$$

Thus,  $A_1$  is more likely under the Naïve Bayes assumption.
